Long Life Type

The following two cases of a short tip life may occur:

- Case where the iron-plated section is holed by corrosion.
- Case where the solder-plated section is blackened and oxidized, resulting in being less wettable.

Case of hole by corrosion

** We would like to recommend you to use a long-life tip*

We would like to recommend you to use a long-life tip. Our specially-processed*1 long-life tip can provide approx. double of the life*2 of a standard tip. The available types and shapes are limited*3, however, we are sure that you will find out the difference.

1. Thermal efficiency may be lower than the standard type in some cases.
2. The above data are only experimental values and are not guaranteed values.
3. Long-life tips are available in four types for 900 Series and 16 types for T12 Series.

Case of being less wettable

** Hakko FT-700 kit is recommend for maintainance*

Please clean the tip with the Tip Polisher **HAKKO FT-700** and **Paste HAKKO FS-100**(provided in Kit). The FT-700 brush removes the oxides, and the FS-100 recoats the tip. The kit is surely recommended for maintenance of a long-life tip.
